

Shift Light Programming Procedure for SportVue MC1

User must have completed installation of the MC1 up to and including test ride.

1. Power up the system holding down the “B” menu button on the MSU. The Helmet Mounted Display (HMD) should show “SETUP” then “GEAR”.
2. Press the “A” button until “SHIFTL” is displayed in the HMD.
3. Press the “B” button to display the RPM bar graph.
4. To set the point when the shift light arrows will display press and hold the “A” menu button. The bar graph will start to move up the scale until it reaches the peak and then will start back at the beginning. The Shift Light will be activated at the point when the RPM matches what is displayed during actual engine run-up.
5. When you have reached the point when you desire the shift light to appear push the “B” menu button to exit the Shift Light programming mode.
6. Press the “A” button until the HMD shows “EXIT”. Push the “B” button to exit.

You should now see the shift light arrows activate every time your RPM graph matches the one that you set.
